2017/6/16 Homework

Homework

Homeworks can be used to solidify your knowledge of the material in each of the chapters. Most homeworks are based on running little simulators, which mimic some aspect of an operating system. For example, a disk scheduling simulator could be useful in understanding how different disk scheduling algorithms work. Some homeworks are just short programming exercises, allowing you to explore how real systems work.

For the simulators, the basic idea is simple: each of the simulators below let you both generate problems and obtain solutions for an infinite number of problems. Different random seeds can usually be used to generate different problems; using the -c flag computes the answers for you (presumably after you have tried to compute them yourself!).

Note: All of these scripts are available individually <u>here.</u> Each single script is available as a gzip'd tar file; for example, type tar xvzf HW-Scheduler.tgz to unpack the scheduler.py script and an associated README.

Each simulator now has a README file that explains how to run the simulator. Previously, this material had been included in the chapters themselves, but that was making the book too long. Now, all that is left in the book are the questions you might want to answer with the simulator; the details on how to run the simulator are all in the README.

NEW: Video. Each simulation will soon have a short video with one of the authors introducing the basic concepts of how to use the simulator to generate homework problems. Exciting, because you have to read less! Not exciting, because you have to hear us speak.

A single <u>tar file</u> containing all scripts is also available; type

tar xvzf all.tgz

to unpack all the scripts once you've downloaded the tar file.

Virtualization

Topic of Interest	Chapter	Video	What To Do
Process Intro	<u>PDF</u>	Video	Run process-run.py
Process API	<u>PDF</u>	Video	Write some code
Direct Execution	<u>PDF</u>	Video	Write some code
Scheduling Basics	<u>PDF</u>	Video	Run <u>scheduler.py</u>
MLFQ Scheduling	<u>PDF</u>	Video	Run <u>mlfq.py</u>
Lottery Scheduling	<u>PDF</u>	Video	Run <u>lottery.py</u>
VM Intro	<u>PDF</u>	Video	Write some code
VM API	<u>PDF</u>	Video	Write some code
Relocation	<u>PDF</u>	<u>Video</u>	Run <u>relocation.py</u>
Segmentation	<u>PDF</u>	Video	Run <u>segmentation.py</u>
Free Space	<u>PDF</u>	Video	Run <u>freespace.pv</u>
Paging	<u>PDF</u>	<u>Video</u>	Run paging-linear-translate.pv
TLBs	<u>PDF</u>	Video	Write some code
Multi-level Paging	<u>PDF</u>	<u>Video</u>	Run paging-multilevel-translate.pv
Paging Mechanism	<u>PDF</u>	Video	Run mem. c
